SUBJECT: New Riello Primary Controls

In the past, Riello burners have used relays to start the burner. New Riello primaries have a built in control transformer and TT terminals similar to a Beckett Burner.

On the right side of the control, TT terminals attach to the thermostat or control board to operate. A closed switch starts the burner. On Thermo Pride equipment the Riello primaries may come with a jumper between the TT terminals. Remove the jumper and install the low voltage connections.

New control

Old control
